

# Breakout Lab 1.1

---

Agent-Ready Work Plan

30 minutes | Groups of two

# Mission

Create one machine-checked `task-plan.json` for retail shipment notifications.

- **Format:** Driver and navigator; rotate after the first validator run
- **Tools:** Claude Code or similar assistant, JSON, and Python
- **Output:** Bounded tasks, ownership, dependencies, checks, and a human gate

Plan the work. Do not implement the notification service.

# From Feature Brief to Execution Waves

# Open the Lab and Run the Baseline

From the companion repository:

```
cd day1/lab1_1_agent-ready-work-plan/start  
python3 validate_plan.py task-plan.json
```

Expect **PLAN INVALID**. Read the contract violations before editing.

You may change only **task-plan.json**.

# 30-Minute Run of Show

| Time  | Checkpoint                                      |
|-------|-------------------------------------------------|
| 0-3   | Mark the contract gate and hub files privately. |
| 3-8   | Compare observations and assign roles.          |
| 8-18  | Complete task cards and dependencies.           |
| 18-24 | Run the validator and repair failures.          |
| 24-27 | Review classifications and human approval.      |
| 27-30 | Prepare the evidence share-out.                 |

# Build the Dependency-Aware Plan

1. Define at least five tasks with one observable deliverable each.
2. Place the shipment-event schema upstream of channel work.
3. Give every file one owner; reserve `router.py` for integration.
4. Use only supplied acceptance commands and valid classifications.
5. Record the human approval point before integration.

# Keep the Coding Assistant Bounded

Use the full prompt in the lab README.

- Inspect the supplied brief, map, commands, plan, and validator.
- Propose changes only to `task-plan.json`.
- Preserve the validator and avoid invented implementation details.
- Review the proposal before applying it.

Reject shared hub ownership or consumers that start before schema approval.

# Verify and Share Evidence

```
python3 validate_plan.py task-plan.json
```

**Expected:** `PLAN VALID`, execution waves, and the human approval point.

Share one sequential or human-controlled task, one rejected alternative, and the evidence behind the decision.

# Definition of Done and Help Order

- The validator exits with status 0.
- Five or more complete task cards have exclusive file ownership.
- Dependencies expose contract, parallel, and integration waves.
- The group can explain one rejected parallelization choice.

If blocked: validator message, repository map, peer hint, then `../solution/task-plan.json`.

# Return for the Bio Break

---

Bring your validator result and one evidence-backed decision.
